M19 Haloperidol

Scope of Practice	EP
Classification	• Antipsychotic
Usual Presentation	• 5mg/1ml ampule
Mechanism of Action	• Haloperidol binds to dopamine D1 and D2 receptors in the mesolimbic pathway. This reduces excessive dopamine activity that can cause hallucinations, delusions, or severe agitation. • Haloperidol also affects other histamine receptors leading to sedation, aiding in the management of acute agitation.
Indications	• Acute psychosis suspected to be secondary to a worsening mental health illness.
Contraindications	• Known allergy • Parkinsons disease • Dementia
Precautions	• Nil.
Side Effects	• Extrapyramidal effects • Hyperactive behavior • Increased muscle tone • Prolonged QT • Torsade's de pointes
Adult Dose & Administration	• 5mg IM (IM administration only)
Pediatric Dose & Administration	• Not for pediatric use
Use in Pregnancy and Lactation	• Pregnancy: Fetal harm has been demonstrated, not recommended for use in pregnancy. • Lactation: Safety has not been established, not recommended for use in lactation.
Additional Information	• Nil.
